

IMPORTANT MEDICINE SAFETY INFORMATION

RECOMMENDED CALCULATION OF CONTRACEPTION DURATION AFTER COMPLETION OF THERAPY TO MINIMISE THE RISK OF GENOTOXIC ANTICANCER MEDICINE-MEDIATED REPRODUCTIVE ADVERSE EVENTS

12 April 2024

Dear Healthcare Professional,

In collaboration with the South African Health Products Regulatory Authority (SAHPRA), the companies listed above would like to inform you about recommended calculations of contraception duration after completion of therapy with genotoxic anticancer medicines (Including potential genotoxic metabolites).

Summary

- The risk of genotoxic anticancer medicines (and their potential genotoxic metabolites)-mediated reproductive adverse events including, embryotoxicity and teratogenicity has been identified.
- To minimise embryofoetal developmental risk while receiving and after completion of therapy with genotoxic anticancer medicines, new calculations for contraception is recommended in female patients receiving the genotoxic anticancer medicines and to female sexual partners of male patients receiving the genotoxic pharmaceuticals.

Background on the safety concern

Due to their genotoxic nature, anti-cancer therapies, may cause spontaneous abortions, infertility or heritable damage to the offspring and possibly to the subsequent generations. In males, genotoxic products may cause DNA damage in the sperm, potentially resulting in adverse events in the embryo or foetus of a female sexual partner. In females, genotoxic products may directly affect the embryo or foetus or may cause DNA damage in the oocytes.

To minimise the risk of drug-induced heritable DNA damage and to ensure that genomic integrity of gametes at the time of conception is maintained, patients are generally advised to use highly effective contraception during treatment and for an adequate period of time following the end of treatment with genotoxic medicines.

The Professional Information (PI) and Patient Information Leaflet (PIL) of genotoxic anticancer medicines listed below will be updated to appropriately reflect the above safety information.

Advice to healthcare professionals

- Male patients should be advised to use highly effective contraception, until the end of relevant systemic exposure to the genotoxic compound including potential genotoxic metabolites (i.e. five half-lives after the last dose) plus 90 days (i.e., 60-75 days for sperm production plus 10-14 days for the transport to epididymis).
- Female patients and female sexual partners of male patients receiving genotoxic anticancer medicines, should be advised to use highly effective contraception, until the end of relevant systemic exposure to the genotoxic compound including potential genotoxic metabolites (i.e. five half-lives after the last dose) plus 6 months (which covers the growth and maturation phase of folliculogenesis).
- Healthcare professionals are urged to report any adverse drug reactions (ADRs) or product quality problems associated with the use of the products listed below to their respective companies, or to SAHPRA via the following eReporting link <https://primaryreporting.who-umc.org/ZA> available on the SAHPRA website (www.sahpra.org.za)
- Alternatively, please complete the ADR reporting form accessible via the SAHPRA website at <https://www.sahpra.org.za/document/adverse-drug-reactions-and-quality-problem-reporting-form/> and email it to adr@sahpra.org.za.
- Additionally, reporting can be done via the Med Safety App. The App can be downloaded into a smart mobile phone through Google Play or App store. For more information on Med Safety App, please use the following link <https://medsafety.sahpra.org.za/>.
- For more information on ADR reporting of products listed below, please contact the SAHPRA Pharmacovigilance unit at pvqueries@sahpra.org.za or alternatively use the contact details indicated below
